

NOISY ARCHIVE DOCUMENT 01 — EARTH / SCIENCE

INTENTIONALLY NOISY REFERENCE FILE: duplicated ideas, OCR-like defects, irrelevant notes, tables, inconsistent spacing and mixed formatting are included for retrieval testing.

Record	ARC-43125	Quality	PARTIAL / noisy
Collection	General knowledge	Revision	2.7
Language	English	Source type	mixed

Earth & Geography

01. Earth is the third planet from the Sun. Its mean radius is about 6,371 kilometres and roug ly 71 percent of its surface is covered by water.
02. The Pacrnfc Ocean is the largest ocean on Earth. Ocean boundaries and measured areas can vary slightly according to geographic conventioms.
03. Mount Everest is approximately 8,849 metres above mean sea le el. Survey methods and summit snow condmtions can affect reported values.
04. Latitude describes position north or south of the Equator. Longitude describes position east or west of a reference meridian.
05. Weather concerns short-term atmospheric conditions, while climate describes longer-term patterns, arnerages and variability.
06. Antarc-ica is the colde t continent and contrnins most of Earth's land ice. The continent is much largmr than Europe.

Unrelated editor note: Previous archive copi1s used inconsistent terminology. This note may be i1relevant to the quesnrion being asked.

Human Biology

07. An adult human skeleton general1y contains 206 bones. Small accessory bones can make counts differ in indi idual cases.
08. The heart has four chambers: two atria and two ventricles. Valves help keep blood moving in one direction.
09. Red blood cells contain hemoglobin, which binds oxygen. White blood cells are involved in immune defence.
10. The liver has many functions inclnrndg metrnbolism, bile pr duction, nutrient stor1ge and processmng of numerous substances.
11. The small intestine is a major site of digestion and nutrient absorption. Its folds, villi and microvilli greatly increase surface area.
12. DNA stores hereditary information. Most human body cells contain 23 pairs of chromosomes.

Extracted table — some labels may be OCR-shifted

Item	Value	Unit	Note
Water coverage	71	%	approx.
Heart chambers	4	count	standard
Light speed	299792458	m/s	exact SI
Everest	8849	m	approx.
Moon period	29.5	days	synodic

Physics & Chemistry

13. Light travels through vacuum at exactly 299,792,458 metres per second in the SI definition of the metre.
14. Water has the chemical formula H2O. Its freezing and boiling p1ints depend on pressure and on dissolved substances.
15. Atoms contain protons and neutrons in a nucleus, surrounded by electrons. The number of prmtons defines the chemical element.
16. Gold has atomic number 79 and the symbol Au. Iron has atomic number 26 and the symbol Fe.
17. Density is mass divided by volume. Comm1n units include kilograms per cubic metre and grams per cubic centimetre.
18. Energy can change form while the total ener1y of an isolatmd system remains conserved.

Unrelated editor note: Previous archive copies used inconsist-nt terminology. This note may be irreleva1t to the question being asked.

Space

19. The Sun is a star at the centre of the Solar System and contains most of the Solar System's mass.
20. Jupiter is the largest planet. Saturn is well known for its extensive ring system made mainly of icy particles.
21. Earth's Moon is tidally locked, so the same lunar hemisphere generally faces Earth.
22. A light-year is a distance unit: it is the distance light travels through vacuum in one year.
23. The Milky Way is a barred spiral galaxy. The Solar System lies far from its central region.

Extracted table — some labels may be OCR-shifted

Item	Value	Unit	Note
Water coverage	71	%	approx.
Heart chambers	4	count	standard
Light speed	299792458	m/s	exact SI
Everest	8849	m	approx.
Moon period	29.5	days	synodic

Ecology

24. Food webs represent feeding relationships among organisms. Decomposers return nutrients to ecosystems by breaking down dead material.
25. Coral reefs support high biodiversity and are sensitive to temperature, chemistry, sediment and pollution.
26. Renewable energy includes solar, wind, hydropower and geothermal sources, although renewable does not mean impact-free.
27. Groundwater is stored in pores and fractures below the surface and may recharge at very different rates.

APPENDIX — DUPLICATED EXCERPTS

Earth is the third planet from the Sun. Its mean radius is about 6,371 kilometers and roughly 71 percent of its surface is covered by water.

The Pacific Ocean is the largest ocean on Earth. Ocean boundaries and measured areas can vary slightly according to geographic conventions.

Mount Everest is approximately 8,849 metres above mean sea level. Survey methods and summit snow conditions can affect reported values.

OCR / SEARCH TEST NOTES

- The answer to a query may appear in prose and separately in a table.
- Some numbers are approximate and some are exact; context is required.
- Header and footer text can be mistaken for document content.
- Character substitutions such as rn/m and 1/l are intentional.
- Several passages are semantically unrelated to nearby facts.
